

Key Features of a DEMOUNTABLE FLOOD BARRIER

MODULAR AND REMOVABLE DESIGN

One of the main advantages of a **Demountable Flood Barrier** is its removable structure. Barrier panels can be installed between permanently fixed posts or mounting points when needed and stored away during normal conditions.

STRONG & DURABLE CONSTRUCTION

Quality materials provide the strength required to withstand water pressure and challenging outdoor conditions. A robust aluminum structure can offer a combination of strength, corrosion resistance

FLEXIBLE INSTALLATION

Demountable flood barriers can be designed for different openings and site configurations. They can protect doorways, gates, entrances, garages, commercial facilities, and other vulnerable points.

EFFICIENT FLOODWATER PROTECTION

When correctly installed, the barrier creates a physical obstruction against incoming floodwater. Sealing components between panels and the ground or surrounding structure help reduce water penetration

EASY STORAGE AND REUSE

Because the panels are removable, they can be stored compactly after use and deployed again when necessary. This reusable approach can make demountable systems a practical long-term flood protection
